SHEET INDEX

Navigation control was by reference to photostereos and/or photo strips. Flight path analysis was achieved by identification of 18mm. ground tracking photographs on the navigation control. The ground tracking camera was operated at a rate of one camera frame per two data samples, such that successive camera frames overlapped. An attempt was made to recover fiducials at intervals of 1.0 kilometre, and only recovered fiducials are shown on the map. During processing the photostereos was controlled using the Australian Metric Grid control points.

⊕ Registration point identified on photostereos.
+ 2000 metre Australian Metric Grid.
