17.7	79.3		HQ HQ	2F	FOSSILIFEROUS + BURROWED LIMESTONE Gray quite heterogeneous limestone. Fine to med grain size with common fossil fragments incl gastropods (e.g. 42.5) branching corals (e.g. 35.0) Tubular structures 2mm diameter infilled with white calcite very common throughout (e.g. 55.2) - possibly worm burrows? Some zones of sedimentary breccias, e.g. 26.4m. Core is disrupted so no clear bedding is preserved. Core is parting along irregular carbonaceous seams (stylolites?) that are commonly oriented 20-40° to c.a. This may be bedding? At 75.75 is 50mm of 5% sphalerite replacing calcite in "burrows". Reduce to NR at 26.35.
