Logging Overview

Logging Overview

12 ¼ in. Section (Run 1, 557 to 2109 m):

Schlumberger Drilling and Measurements provided MWD and LWD services with the PowerPulse and CDR tools in the 12 ¼" section of Thylacine-2. The PowerPulse was installed with an MVC cartridge and an IWOB sensor. These provided real-time vibration and DWOB/DTOR data to the client, data that was utilized to optimize the drilling program. The data indicated that low level lateral shocks were present throughout most of the section, and that axial shocks were minor and of little consequence. However, severe torsional vibrations were also detected periodically in the section, and were of concern between 1325m and 1408m. During this section the drilling parameters were adjusted, easing the impact of the shocks on the BHA. It was also considered that the aggressive nature of the PDC bit, and the heave of the rig at this time contributed to the severe nature of the vibration, and therefore it was impossible to eliminate completely.

The 12 ¼" section was rotary drilled in a single run, and logged utilizing CDR and PowerPulse. The following formation evaluation data was provided in real-time:

- ☐ CDR 2MHz Phase Shift Resistivity
- ☐ CDR 2MHz Attenuation Resistivity
- ☐ CDR Gamma Ray
- ☐ MWD Directional Surveys
- ☐ MWD 4-axis vibration analysis
- ☐ MWD downhole WOB and torque

The following recorded mode formation evaluation measurements were provided once the LWD tools were on surface and the memory data retrieved:

- ☐ CDR 2MHz Phase Shift Resistivity
- ☐ CDR 2MHz Attenuation Resistivity
- ☐ CDR Gamma Ray

Run	Hole Size (in.)	Service	Start Depth (m)	Stop Depth (m)
1	12 ¼	PowerPulse / CDR / MVC / IWOB	557	2109

The MWD and LWD tools performed well throughout the 12 ¼" section, and no problems were encountered. Shocks throughout the run were minimal, with the exception of the torsional vibration, and of no consequence to the MWD and LWD tools. Real-time data between 794m – 822m and 827m – 831m was lost while the depth tracking system was changed from the draw-works encoder to the geolograph. Recorded mode data for this section was retrieved from the tool and processed without incident.

Purpose of Run	Performance motor run for the 12 1/4" hole section. Hole section target ROP objective 1550m in 47 hrs = 32.98m/hr. Actual section 1552m drilled in 33.6 hrs = 46.19 m/hr. Note that section 17.7 of the Woodside "DOG" does not apply to Schlumberger motors. The A962GT had sufficient power at 350 pressure differential (+/- 24k wob) to stall the TDS at 20,000 ft lbs. Held 50 m/hr run average up to 2043m, here drilling mechanics changed. ROP dropped to +/- 22m/hr

Well : Thylacine-2	District : AWA	Job No. : AWA-18-01
Cell Mgr. : Lee Muskett	Service : MWD/MVC/CDR	Run No. : 1
EQUIPMENT & SERIAL No. : CDR Personality Adapter		

FAILURE DESCRIPTION & SYMPTOMS (Include software version if applicable)
<p>Both CDR tools were programmed during the previous day. The equipment used for the operation included the CDR personality adapter, TSIM cable, and TSIM.</p> <p>Prior to picking up BHA the CDR was again connected to the IDEAL system, however, communication with the tool was not achieved.</p>
Failure Group : Failure Category : Completed by : Lee Muskett Date : 30-8-01

REMEDIAL ACTION ATTEMPTED ON LOCATION
<p>Several attempts were initially made to establish communication with the tool, this was not successful. All of the connections were checked, cleaned and re-established. Further attempts to communicate were made, but all proved to be unsuccessful. In an attempt to troubleshoot the problem the back-up CDR was plugged into, this also proved to be unsuccessful which suggested that the problem was associated with the cables or TSIM, and probably not the CDR. Therefore, a back-up cable was installed and communication made with the CDR. The CDR was initialized on the pipedeck and the BHA assembled. Later examination of the TSIM and TSIM cable proved that they were in good working order, therefore, the problem was associated with the personality adapter.</p>

EQUIPMENT & SERIAL No. : Geolograph Air Pressure Regulator

FAILURE DESCRIPTION & SYMPTOMS (Include software version if applicable)				
<p>After installing the cable on the geolograph cable drum and connecting it to the rig top drive, the air pressure was increased in order that adequate tension was exerted on the line to achieve accurate depth tracking. It was instantly noticed that the movement of the cable and the internal workings were erratic, and that the air pressure was uncontrollable by adjusting the regulator. If this situation had been allowed to remain it would have resulted in inaccurate depth tracking, and premature wear of the cable and air motor.</p>

REMEDIAL ACTION ATTEMPTED ON LOCATION			
<p>In an attempt to ease the movement of the cable, all moving parts and grease nipples were lubricated, this helped to a point but it was still not satisfactory in regard to depth tracking. It was then decided to reduce the air pressure by adjusting the main valve. This proved to be difficult and time consuming as the valve was unable to control the air flow as accurately as was required. Unfortunately, the air motor would stop retrieving the cable intermittently if the flow was slightly too low, regardless that when it was working there was a reasonable amount of tension on the cable. Furthermore, with too greater air flow the geolograph seemed to struggle, increasing the wear on the motor and the cable. At that point it was concluded that we had to achieve accurate depth tracking and the main valve was adjusted accordingly regardless of premature wear to the geolograph.</p>
